

2026 Mini Challenge

In the mini challenge you're request to form **groups of 2-3 persons** and hand in a time series analysis and forecasting pipeline.

1. Chose a dataset among the proposed one
2. For the chosen dataset, forecast the target through the following steps:
    a. EXPLORATORY ANALYSIS. E.g. data plotting, correlation plots, ACF, etc..
    b. MODEL BUILDING. E.g. check stationarity, transform, choose model & fit, check residuals
    c. CV and model SELECTION.
    d. Presentation of results

Keep your code:

- **Clean and well-organized**
- **Efficient** – avoid extremely long runtimes; (if it takes 1 hour to run assume it is not usable, alternatively, warn the user and explain very well why it should take so long)
- **Commented** – your code should be easy to understand without guessing.
- **Short -** Chatgpt implementations tend to be long, I would like to correct **your** code

You can hand in a notebook or (*extensively*) commented running code, **by Nov 5th**

Electricity Transformer temperature
